## TAILORED TO WIRELESS

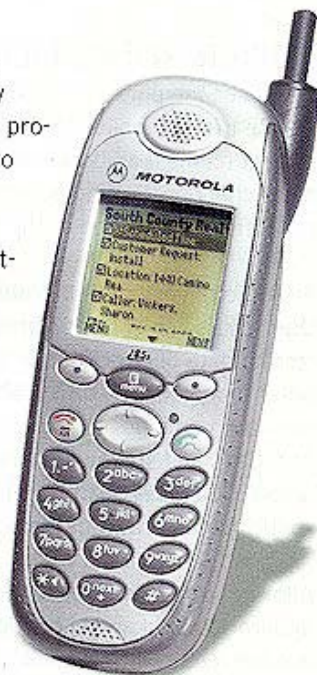

Ensuring that a software solution is tailored to fit the business requirements of a construction company and not the other way around is mission No. 1 when implementing technology. Yet, for professionals in the field this isn't always the case when it comes to emerging technology such as wireless—until now.

DispatchSuite from JumpStart Wireless, Boca Raton, Fla., is a software application for wireless devices that can be custom fit to your company's business requirements. As a wireless data solution for the construction, field service, and facility management industries, DispatchSuite is used for wireless time cards/payroll, daily reports, inspection reports, and work orders.

JumpStart takes a company's paper-based documents and creates wireless versions that are tailored specifically for the business processes of the company. It is customized with the information that a company wants out in the field as well as the information needed back in the office.

Companies are able to speed up billing cycles, reduce the number of people working in the field, minimize errors by capturing data at the source, track staff more effectively, and eliminate the endless amounts of paperwork that often consume businesses.

More information is available at
